

Figure 1 is a line plot showing the performance of various machine learning models across different values of a parameter (likely regularization or learning rate). The x-axis ranges from 0.0 to 0.7. The y-axis represents performance, with a horizontal dotted line at approximately 0.85. The models are: Logistic F (blue solid line), Random (orange solid line), Gradient (green solid line), SVM (red solid line), Gaussian (purple solid line), XGBoost (brown solid line), Treat all (grey dashed line), and Treat non (black dotted line). The 'Treat non' line is constant at the dotted level. The 'Treat all' line decreases sharply from 0.0 to 0.7. The other models show a slight initial decrease followed by a plateau or slight increase.
